Railways Reservation Management System

This project is designed to manage railway reservation operations using Microsoft SQL Server.

The database stores information about passengers, trains, stations,train route,schedules,coach,passenger,seat,cancellation and ticket bookings.

The project uses SQL concepts such
1)Constraints
2)Joins
3)Subqueries
4)CTEs
5)Stored procedures
6)Rank functions

Objective: To simplify railway reservation management and retrieve useful information about trains,passengers, schedules, ticket fares, and bookings.

Database Details

Project name: Railways Reservation Management System

Database name: RailwayDB

Database technology: Microsoft SQL Server

Language: SQL (T-SQL)

Database type: Relational Database Management System (RDBMS)

Purpose: To manage railway information, train schedules, passenger details, and ticket reservations.
